Download the 2020 Reloader Guide To get the printed version of the Alliant Powder Reloaders Guide. Please fill out the form below. Allow 3-4 weeks for delivery. Shipping is only available in the U.S. and Canada Find Dealer Trending: Amazon Prime Day Offers (Tactical Edition) Ammunition Reboot is a great way to save money and get custom ammunition that takes your shooting to the next level. Plus it's just fun. Mmmmm, shiny ammunition is my favorite. But to do it right - and in a way that won't get your gun, hands, or your face damaged - you're right to reboot the data. Traditionally, people have used the reboot guide as a resource to get the information they need. But who uses the actual books anymore? ... well I do, but the thing I'm trying to do here is that these days you can find everything and everything on the internet, including digital data reboot tools. I'm not kidding about everything and everything a bit. Of course, there's nothing wrong with using a physical reboot guide if you prefer, but online data reboot tools are really useful. Plus... Online data reboot tools are free. And they are updated constantly, so there is no need to go out and each new edition to make sure that you have a data reboot for the newest rounds. Sold for rebooting data tools yet? Pew's Pew Tactical Founder and Editor, Eric Hung rebooted the station well because I'm going to show you some of the most useful data reboot tools on the web, and it would be very uncomfortable for both of us right now if you weren't interested. Some Vocab for the uninitiated I'm going to skip basic ordnance terms like bullet, chuck, and round, but you can learn more about the basics of ammunition by checking our final resources on ammunition and rebooting. Instead, I want to talk very quickly about two terms: the starting load and the maximum load. You can guess what they relate to, but in case the starting load is the minimum recommended amount of powder grains (grs, gr, or grn all stand behind the grains) for use in the round. This is also commonly referred to as a minimum load or a minimum starting or starting load. Not every tool gives a minimal start load recommendation, since there are several reasons that you can reduce the load, or intentionally use less powder in, your round, like creating a subsonic round or reducing recoil. If you plan to compete with rounds, keep in mind that most competitions have a minimum power factor for used ammunition, so you can't down the load of your rounds of competition too much. (If you're not sure what that means, read our guide to developing loads for beginners for more information.) In development Round, start with a minimum starting load and build up from there to determine exactly how much powder you want in your recipe. The maximum load, on the other hand, refers to the highest recommended amount of powder for round use and is much less flexible than the minimum load. When it comes to overloading your round, the best scenario is to create a creation Round that is more powerful than you can control, damaging accuracy and maybe you're over-recoiling, but you can also end up with a round that creates too much pressure by damaging the gun. The video below shows you how to tell if your reloaded ammo will have excessive pressure. If you are new to the restart or even if you have been around the unit several times, you should give it a watch to help you and your gun stay safe when you are reloading. Although extremely rare, an overload round can even cause it to explode, destroying your firearm and sending you to the hospital. Not a great way to finish your day range, so just don't overload your rounds and just generally be careful of rebooting because it can be dangerous if you're not careful, okay? Ok. Now that I know you're not going to hurt yourself (or at least if you do it's not my fault), let's move on to the tools yourself. Hodgdon Reloading Data Center Hodgdon Reloading Data Center Hodgdon Powder Company is one of the world's largest producers of smokeless powder under the brands Hodgdon, IMR and Winchester, as well as goEX black powder. These are some of the most popular powder brands on the market right now, so it's easy to see why Hodgdon's online data reboot tool, Hodgdon's reboot data center, is so widely recommended. It's also super easy to use. For rifle and pistol reloading, just select the cartridge you use and it will return the data for you to view for each bullet weight, manufacturer and powder in their lineup or you can choose the weight of the bullet, the manufacturer, and/or the powder that you want to use to get more targeted results. To recharge the shotgun, simply put in the sensor and shell to view your options, or get specific also entering your preferred type of load, shot weight, manufacturer, and powder. Hodgdon Reboot Data Center Pistol Reboot data tool Hodgdon also allows you to look at data up to four different pistol cartridges, or shotgun projectiles at the same time, making it easier to link back and forth between different rounds. You can print out the data or email it to yourself or someone else to share it or send it later. Hodgdon Reboot Data Center provides data only for Hodgdon powder production, but chances are pretty good that you're using one already and with so many great powders available from the Hodgdon brand, you're sure to be able to find a powder that works for you. Just select the cartridge and bullet weight (or calibration, shell, load type, and shot weight) that you want to use and then look at the data to see what the powder is. The speed and pressure you are looking for. Sampling data for the 9mm Luger from Hodgdon Reboot Data Center And if you're looking for more information about loading ammunition, you can also browse the Hodgdon Reboot Education section for some comprehensive but easy to understand reboot help. One drawback: Hodgdon provides data only for rifle, pistol, and ammunition, but not for revolver ammunition. How do you take The Hogdon instrument? Alliant Powder Reloader's Guide Alliant Powder Reloader's Guide Alliant Powder's Reloader's Guide isn't as useful as Hodgdon Reloading Data Center, but if you prefer to use Alliant powder, it'll still get the job done. One thing to note about the Alliant Powder Reloader Guide is that it provides recipes rather than ranges for powder, making it more difficult to figure out how much of what powder to use to get the speed you want. Alliant suggests starting the round with 10 percent less than the recommended amount of powder in the recipe and working your way to determine the right amount of powder for you. The amount in the recipe is the maximum load, so do not exceed it. Alliant Powder Reloader's Guide The Reloader's Guide isn't a handy little tool where you just put it in the cartridge and the data bullets, and it brings back a neat little box with everything you need to know. It's more of an index. The guide is primarily focused on the shotgun data reboot, so from the homepage you'll follow the link for sensor and shell type, and then from this page, you'll find your body and shot the weight and follow this link to pull up your recipe. For rifle and pistol ammo, you'll follow the link for your category (Cowboy Action Pistol, Pistol/Revolver, or Rifle) from the homepage, then go to the link for your cartridge and bullet type. Unlike Hodgdon, Alliant Powder provides data on reloading revolvers, but also provides only reboot data for centerfire rifles and pistol loads. VihtaVuori Reboot Data VihtaVuori Reboot App The next data reboot tool in our list of vihtaVuori data reboot guides. The site itself is quite simple. Choose your category (rifle, pistol, or cowboy action shooting), choose a caliber, then find a bullet and powder type on the table for your minimum and maximum loads, or browse the data table to help you find the right powder for you. Not so flashy or fun to use as a Hodgdon tool, but it's so simple, intuitive, and organized that it's almost impossible to get confused. Where VihtaVuori really stands out, however, with their free app VihtaVuori Reboot. VihtaVuori Reboot App Example Entry Reboot app gives you offline access to the same tables that you can find on the VihtaVuori website. That's pretty handy if your workshop is in a shed in the backyard without a Wi-Fi connection. But the coolest part of the app is the diary. No, it's not for writing about your feelings (although if you want to do it, there's more power for you). Rather, the diary function is a dream to develop loads and write recipes. VihtaVuori Reboot App Diary Entry for each entry, you can save detailed information about powder, bullet, primer, case (including the number of times as loaded and cropped as it has been re-cut, clipped length, and cleaning method), and final cartridge, as well as date date goal boot, the gun he was shot out of, and even rated for his performance. If that's not enough, there's a note section that you can use to record any other information you might want to save. And if you want to write about your feelings, you can do so in the note section, too. It's a diary after all. VihtaVuori Reboot App Is a New Diary Entry And you can use a diary with any powder you like, even if it's not made by VihtaVuori, so Reload is a great app for those who love the development load, no matter what brands they prefer. The exact reboot of Powders Loading Data Accurate reboot Of Powders Load Data Latest is downloading data from an accurate powder reboot, but there really isn't much to say about it. The full accurate download guide is more of a PDF reboot guide than a data download tool, but that's not necessarily a problem. If you really like to use a reboot guide but don't like the cost or space it takes up, the data reboot and download guide gives you the best of both worlds. You can always print out the only pages you need if you still want a printed copy, but not all of it. The Accurate Reboot of The Powder Reboot and Data Download Guide Accurate also provides a at first-look guide to PDF format for its popular Nitro 100, Solo 1000, Accurate TCM, and Accurate No. They're great for quick searching from your computer or phone without missing all the extra things you don't need, or you can print them out and pin them in the workspace so you have load data when you need it without having anything extra on your work bench. The PDF format also means that you can download whichever version you prefer to have your computer or mobile device available for offline access when you need it. Withdrawal regardless of whether you're using a reboot guide or a digital data reboot tool, making sure that you have accurate reboot data is essential to producing the best rounds. Any of these data reboot tools will serve you well. What's best for you depends on your personal powder and rebooting data tool preferences. My personal favorites are Hodgdon rebooting the data center to get the data reboot and the VihtaVuori Reboot App to record information about load development and recipes. We know it's just scratching the surface of the world reboot, we have a lot more information in our beginner guide to rebooting! Do you use a data reboot tool or a reboot guide? Which one? Still have questions? Let me know in the comments! Ready to get powder ... Check out the best places to rebooting supplies. Supply.
